

ABSTRACT

It comprises an electric conduction pattern member (11) which is flexible and plate-shaped, a gel member (13) having the electric conduction pattern member embedded therein, and flexible substrate sheets (15a, 15b) holding the
5 gel member therebetween, the electric conduction pattern member (11) having the function of allowing the gel member (13) to be deformed and displaced by an external bending force, the stress due to the external bending force being dispersed by the gel member (13).
